| **Analysis Method:** | RLT Forest + Ensemble Models |

## MALIGNANT TUMOR DETECTED

Model Confidence: 54.5%

## Detailed Analysis

| Metric | Value | Interpretation |
|---|---|---|
| Malignant Probability | 45.48% | Low |
| Benign Probability | 54.52% | Moderate |
| Model Confidence | 54.52% | Low |

## Clinical Interpretation

**MALIGNANT PREDICTION:** The AI model has detected characteristics consistent with a malignant tumor. This result indicates that the analyzed tissue sample exhibits features typically associated with cancerous cells.

**Recommended Actions:**

- Immediate referral to oncology specialist
- Additional diagnostic imaging (MRI, PET scan)
- Biopsy confirmation if not already performed
- Discussion of treatment options with medical team

• Patient counseling and support services
